Saturday, August 16, 2013 Does alcohol affect sexual desire? I have known people who are quite driven by sex and have a wide range of sexual partners. They are also generous with their time and are happy to go out in the evenings or on the weekend. But their libido is often unpredictable. Sometimes they don't experience desire and are bored sexually. Other times they may have too much and find themselves too drunk to achieve orgasm or in the midst of an activity, they lose desire. Does alcohol affect sexual desire? Those with sexual dysfunctions have found that alcohol helps alleviate some sexual difficulties such as erectile dysfunction. Often, women with low desire have issues with lubrication, desire, or arousal. Alcohol has been known to reduce some of these problems. Women with orgasmic difficulties may be able to achieve orgasm with stimulation. The tip of the tongue is often used as a sexual stimulator and may not be affected by alcohol. There is often an increase in oral stimulation to achieve orgasm. Is there a correlation between the amount of alcohol you consume and your desire for sex? There is no clear correlation between alcohol and sexual desire. An individual may experience desire and be able to maintain an erection even though they may be drunk. This is why many men drink at the end of the day when they are tired and not at their best physically and mentally. What about a person who is sober but who wants to be sexual with their partner? There are many factors at play here. Alcohol reduces a person's physical and mental ability to be in tune with another person. The person may be able to have a good conversation, but not really be "in tune" with their partner's emotions, needs, or desires. Or, they may be too drunk to even be able to figure out what their partner is doing or if they are doing something they don't enjoy. Is it possible to have sexual desire even though the person is drunk? Yes. It is possible for a person to
