In 2006, a model for the entire code base was created, the DXF Archival Model. This model was intended to provide a solution to the issue of how to deal with large drawings. By leveraging the DXF Archival Model, it is possible to write software that can work with a number of drawing formats. The global population is projected to double by 2050. The increase in the world's population is likely to be met with a rise in energy demand. This in turn could lead to more environmental damage such as the release of greenhouse gases. But one of the simplest steps to take in avoiding this problem is to recycle. In fact recycling is a great way to use excess food, used paper, and housewares. On a global scale, it has a huge potential impact. A report called the Global Environment Outlook shows that, through recycling, we could cut our carbon emissions by one third in 2050. So how does recycling work? Currently, there are more than fifty billion tons of waste products from the production of food and other materials. However, just 20% of this waste is recycled. Our recycling system consists of sorting different materials, mixing them together to make new materials, and cleaning the mix. Then they go on to become new products. For example, the sorting process separates the rubbish into a number of different categories: glass, plastics, tin, paper, and metal. The most
